

## **AMECA List of Diffusing Plastic Materials**

October 10, 2025

**List of**

**Diffusing Plastics Used on Motor Vehicles**

---

**October 10, 2025 Edition**

**Automotive Manufacturers Equipment Compliance Agency, Inc.  
1025 Connecticut Avenue, NW Suite #1000  
Washington DC 20036**

**[www.ameca.org](http://www.ameca.org)**

## 1. STATUS

The following materials have been accepted by the Automotive Manufacturers Equipment Compliance Agency as meeting the weathering test procedures and criteria for cracking, crazing, color, and delamination of FMVSS 108. The materials do not meet 108 haze requirements. No evaluation has been made as to the suitability of individual materials for particular automotive uses, or to the manufacturing methods.

***You must contact the resin or coating manufacturer to determine the best material for your application.***

***Every plastics resin manufacturer has specialized products for different applications, processing conditions, manufacturing equipment, light sources and final use.***

The device manufacturers must ensure that the lenses molded from acceptable materials meet the color and plastic stability test requirements for each individual device.

## 2. LISTING

The material is listed by the manufacturer's name, trade name and flow formulation, type of resin, color number and color.

## 3. DISTRIBUTION

This list is distributed free on a monthly basis. Any revised or pre-release editions may be obtained by contacting AMECA.

## 4. DEFINITIONS

Coating -- Material applied to surface of the lens to improve some aspect of performance.

Coated materials-- a material which has a coating applied to the surface of the finished sample to impart some protective properties. Coating identification means a mark of the manufacturer's name, formulation designation number, and recommendations for application.

Color bleeding -- the migration of color out of a plastic part onto the surrounding surface.

Cracking -- a separation of adjacent sections of a plastic material with penetration into the specimen.

Crazing -- a network of apparent fine cracks on or beneath the surface of materials.

Delamination -- a separation of the layers of a material including coatings.

Hard Coat --     1) Coating which is cured by UV radiation.  
                      2) Coating which provides additional resistance to abrasion or scratching which may be cured by thermally or by UV radiation. May contribute to long term durability of material.

**NOTE:** Both definitions are being used--please verify the intended performance when discussing hard coats.

Haze -- the cloudy or turbid appearance of an otherwise transparent specimen caused by light scattered from within the specimen or from its surface.

UV-protective Coat -- Coating designed to provide additional protection from the sun's electromagnetic radiation, particularly those wavelengths in the UV bandwidth. Often used on polycarbonate substrates to improve weathering performance. Polycarbonates must be coated for use in or in front of reflex reflectors.

Reflex reflectors-- devices used on vehicles to give an indication to approaching drivers using reflected light from the lamps of the approaching vehicle.

Substrate -- Base material to which all other performance enhancing materials are added.

UV radiation -- Short wavelength, high energy radiation emitted by the sun or other object (HID lamp). Wave lengths between 10 and 380 nm.

HID Lamp -- High Intensity Discharge Lamp. Lamps produce light by the use of a stabilized arc. Lamps can produce significant UV radiation which may require special materials. See SAE J-1647

## 5. NOTE ON COLOR

The colors listed have been determined to be in compliance with SAE J-578 using the ASTM E 308-66 method in thicknesses specified by the resin manufacturer (SAE J576 S4.1).

**NOT EVERY COLOR LISTED WILL MEET SAE J-578 COORDINATES  
FOR YOUR INTENDED THICKNESS**

**NOT EVERY MATERIAL IN EVERY COLOR WILL MEET J578 WITH  
LED OR ILLUMINANT C LIGHTSOURCES**

**CHECK WITH THE RESIN MANUFACTURER'S COLOR SPECIALIST**

The ASTM E 308-66 method uses an illuminant A light source energized to 2856k. *If you use anything other than an incandescent light source at 2856k you MUST verify that the resulting color meets the specifications of SAE J-578 for your intended thickness.* Halogen light sources at 3200k, illuminant C (strobe) and LED light sources can alter the color output. In addition, some light sources do not emit color or luminous flux uniformly. Measurements should be made to verify that the emitted light using your intended lightsource meets the specifications of J-578 throughout its photometric range.

## 6. NOTE ON INNER LENS COLOR

*Combinations of inner and outer lenses with various colors may not perform predictably. Output can vary with different light sources. Check with the resin manufacturer's color specialist when making selections.*

## 7. NOTE ON "EQUIVALENT" FORMULATIONS.

Many companies have distributed manufacturing facilities, cooperative agreements or joint ventures. In order to list a facility or another company the company which has done the three year weathering testing must send documentation stating that the materials, processes and end products are equivalent between itself and the new applicant. Due to industry complaints, the List of Acceptable Plastics has revised the listing to more accurately reflect the test data from various parent companies. ***In addition, if the joint***

*venture is terminated or the manufacturing facility is sold, the subsidiary or joint company must be able to provide weathering test data on its own. A company can no longer rely on the parent company data and processes if they have no relationship to the parent company who conducted the original testing.*

## **8. NOTE ON SUBMITTING FOR ADDITIONAL COLORS**

If you plan to add an additional color number to your listing, please list the existing colors which have undergone the three year weathering that are a greater and lesser concentration. The colors listed **MUST** be in the same color space.

## **9. Note on Inner Lens Testing**

Currently SAE has issued no guidelines for inner lenses. If and when they do, they will be the requirements that everyone must follow. In the meantime, we would recommend for following guidelines for inner lens test setup.

- 1) You must bracket test every color combination (light/dark) you want to use—red, blue, amber, etc. The light/dark colors must be in the same color space.
- 2) You must bracket test molecular weight (heavy/light) for both outer lens and inner lens.
- 3) The test setup—airspace, ventilation, should duplicate as close as possible the conditions in an inner automotive lens including factors such as ventilation, spacing between inner and outer lens and coatings.
- 4) For more information, please see SAE Paper: <http://papers.sae.org/2004-01-0800>

Inner lens materials will be listed as a system. Both the inner lens and outer lens material/color will be listed *together*. If you only test a limited range of lens colors, thicknesses or materials that is how they will be listed.

## **10. Special Note on the definition of “Protected Inner Lens” and/or “Protected Applications”**

**Protected Inner Lenses or Protected Applications for polycarbonate lenses refers to an outer lens which has a UV absorbing capabilities. NOT physical protection but UV protection.**

## Frequently Asked Questions

Q1) If someone else has weathered a polycarbonate/PMMA material, do I have to weather my polycarbonate/PMMA material?

A) Yes, every company's material stands independently from what another company has done. Each coating, pigment and additive must be tested with each company's own material. Each separate material stands alone for weathering performance unless bracketed by materials of higher and lower concentrations or molecular weights.

Q2) If someone else has weathered a pigment with another plastic do I have to weather the pigment with my plastic?

A) Yes, every company's material stands independently from what another company has done. Each coating, pigment and additive must be tested with each company's own material. Each separate material stands alone for weathering performance unless bracketed by materials of higher and lower concentrations or molecular weights.

Q3) If someone else has weathered a coating do I have to weather my material with that coating?

A) Yes, every company's material stands independently from what another company has done. Each coating, pigment and additive must be tested with each company's own material. Each separate material stands alone for weathering performance unless bracketed by materials of higher and lower concentrations or molecular weights.

Q4) How many thicknesses do I have to test?

A) SAE 576:  $1.6 \pm 0.25$  mm,  $2.3 \pm 0.25$  mm,  $3.2 \pm 0.25$  mm, and  $6.4 \pm 0.25$  mm.

Q5) Even if it's for a coating?

A) Yes.

Q6) Do materials have to meet the color requirements before testing?

A) Yes: Samples for the thicknesses specified by the manufacturer must conform to the applicable color test requirement of this standard prior to testing. If no special thicknesses apply, then all 4 used by SAE J576 must comply.

Testing outline. Note, we also recommend you send DOUBLE samples to prevent any errors.

► 4 Thicknesses

- For each colour
- For each coating
- For each molecular weight (MW)

► For example:

- 4 thickness samples of dark red, uncoated, Lowest MW
- 4 thickness samples of light red, uncoated, Lowest MW
- 4 thickness samples of dark red, uncoated, Highest MW
- 4 thickness samples of light red, uncoated, Highest MW
  
- 4 thickness samples of dark red, coating 1, Lowest MW
- 4 thickness samples of light red, coating 1, Lowest MW
- 4 thickness samples of dark red, coating 1, Highest MW
- 4 thickness samples of light red, coating 1, Highest MW
  
- Now repeat for clear, yellow, blue, coating 2 & coating 3
